

When used with Arduino, the ICSP 2x3 connector has to be soldered to the board. In case the module has to be used with olimexino the 2X3 connector is not soldered, instead solder 1x1 pin header and connect +5V and GND to Olimexino +5V and GND.

The switch is used for switching the MCP2120 into a command mode for setting up the needed baud rate. Please refer to MCP2120 datasheet for the commands needed to switch between the different baud rates.

The unit supports standard baud rates between 9600 - 115200 baud. The factory Baud rate is 9600.
